

Create Your Own Class

Introduction

In this task, you will design and implement a Java class based on your personal interests or hobbies. This exercise will help you practice object-oriented programming concepts and reinforce your understanding of classes, objects, methods, and variables.

Task Overview

You will create a class that represents something from your interests or hobbies. For example, if you're interested in books, you might create a Book class; if you like sports, you could create a SportsTeam class.

Task

1. **Choose Your Topic:** Select a subject from your interests or hobbies that you can create as a class.
2. **Design Your Class:**
 - a. Identify at least 3 attributes (variables) that describe your chosen Class.
 - b. Plan at least 2 methods that perform actions related to your Class.
 - c. Consider what constructors you'll need.
3. **Implement Your Class:**
 - a. Create a new Java file with your chosen Class name.
 - b. Declare your instance variables with appropriate data types and names.
 - c. Implement a default constructor and at least one parameterized constructor.
 - d. Implement the methods you planned in step 2.
4. **Test your Class:**
 - a. Create at least 3 different objects of your class using different constructors.
 - b. Demonstrate the use of your class methods with these objects.
5. **Add Functionality:**
 - a. Implement at least one method that takes parameters (and does something based on the provided parameters).
 - b. Create a method that modifies the state of the object.
